

Multi-Column Layout Simulation

Two-Column Content

Left Column Content

This document simulates a multi-column layout by using shorter paragraphs that would typically flow in columns.

First paragraph of left column with enough text to demonstrate extraction.

Second paragraph with more content to fill the space appropriately.

Third paragraph continues the flow of the left column content area.

Right Column Content

Meanwhile, the right column has its own independent content stream.

This content should be distinguished from the left column.

The right column continues with more information.

Three-Column Section

Column A

Short text in column A.

More text here.

Even more content.

Column B

Short text in column B.

Additional information.

Continuing in middle.

Column C

Short text in column C.

Right side content.

Final column data.

Complex Layout

Some documents have complex layouts with:

- **Sidebars** containing supplementary information

- **Main content** in the center
- **Headers and footers** with metadata
- **Callout boxes** with important notes

Note: This is a callout box that might appear in a sidebar or highlighted section.

The main body continues here with regular paragraph text that flows normally.

Another Section

More content to demonstrate layout complexity.

Feature	Description
Layout	Multi-column
Detection	Automatic

Back to regular text flow.
