

THE POWER OF DATA

How Data and Analytics Drive Business Growth

Our company

ITSalesBooster was founded by two Data enthusiasts whose complementary skill sets combine Tony's **technical expertise** and Alice's **business vision** to deliver tangible and measurable results.

Our mission is to help companies accelerate their growth by leveraging their data: through centralization, automation, and intelligent exploitation, while **ensuring the required security and compliance** for each sector.

We support them in reducing costs, gaining efficiency, and better driving their decisions using tailored Data & AI solutions.

Thanks to our international expertise, our clients benefit from comprehensive support—from consulting to implementation—at a controlled cost.

Alice MILLOT
International Project Manager

- Strategic Analysis and Consulting/Support
- Design/Conception and Business-Oriented Vision
- Governance & Change Management
- Complex Project Steering/Management & Team Coordination
- Sales & Business Development (BizDev) Training

THE DATA-DRIVEN IMPERATIVE

- ④ Analyzing Customer Data
- ④ Segmenting Customer Base
- ④ Personalization Strategies

- ④ Improving Customer Experience
- ④ Leveraging Customer Feedback
- ④ Measuring Personalization Impact

Information Overload

Companies collect everything (ERP, CRM, Web, Logs) but the data is scattered, unstructured, duplicated, and therefore inaccessible for rapid decision-making.

Deciding Blindly: A Risky Bet

Without reliable, up-to-date data, strategic decisions (business processes, marketing targeting, R&D investment) are based on instinct or experience, not on market reality and factual analysis.

Loss of Competitiveness and Agility

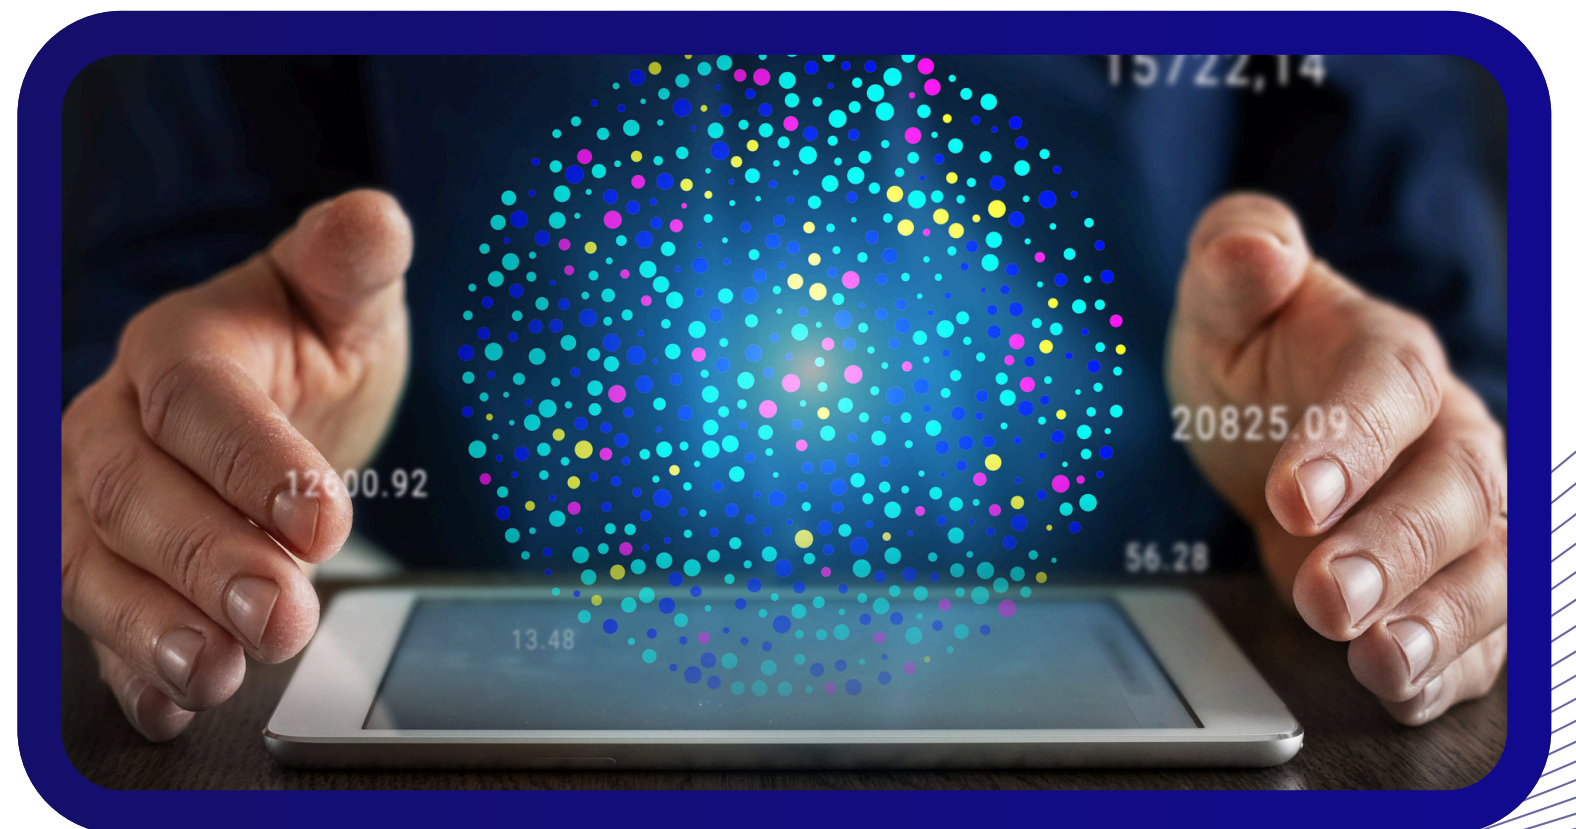

Your competitors, even SMEs, are adopting the Data-Driven approach. Poor data exploitation means leaving money on the table (missed opportunities) and losing reactivity to change.

The Data Imperative: From Intuition to Factual Action

Being **Data-Driven** is not just about having dashboards. It's about transforming every piece of data into a measurable action that improves your product, customer relationship, or operational efficiency.

The Outcome:

- **Precision:** Moving from "I think that" to "I know that."
- **Speed:** Decreasing the time between the need for information and obtaining the relevant answer.
- **Scalability:** Preparing the organization for the future integration of AI/ML, which relies entirely on data quality.

The 3 Pillars of a High-Performing Data Strategy

I. The Foundation Technology & Architecture

 Reliable and Accessible Data

- **Cloud & Architecture:** (GCP, Azure, AWS) Setting up a robust and scalable Data Platform (DWH, Data Hub).
- **Data Quality:** Defining quality rules and controls to guarantee data reliability.
- **Security & Compliance:** Managing access (IAM) and complying with regulations (e.g., GDPR).

II. The Culture People & Governance

 The Data-Driven Organization

- **Data Governance:** Who is responsible for the data? Data Owners, Data Stewards.
- **Methodology:** Adopting Agile and DataOps for fast and stable production releases.
- **Upskilling & Change Management:** Training teams to embrace new tools and the data culture.

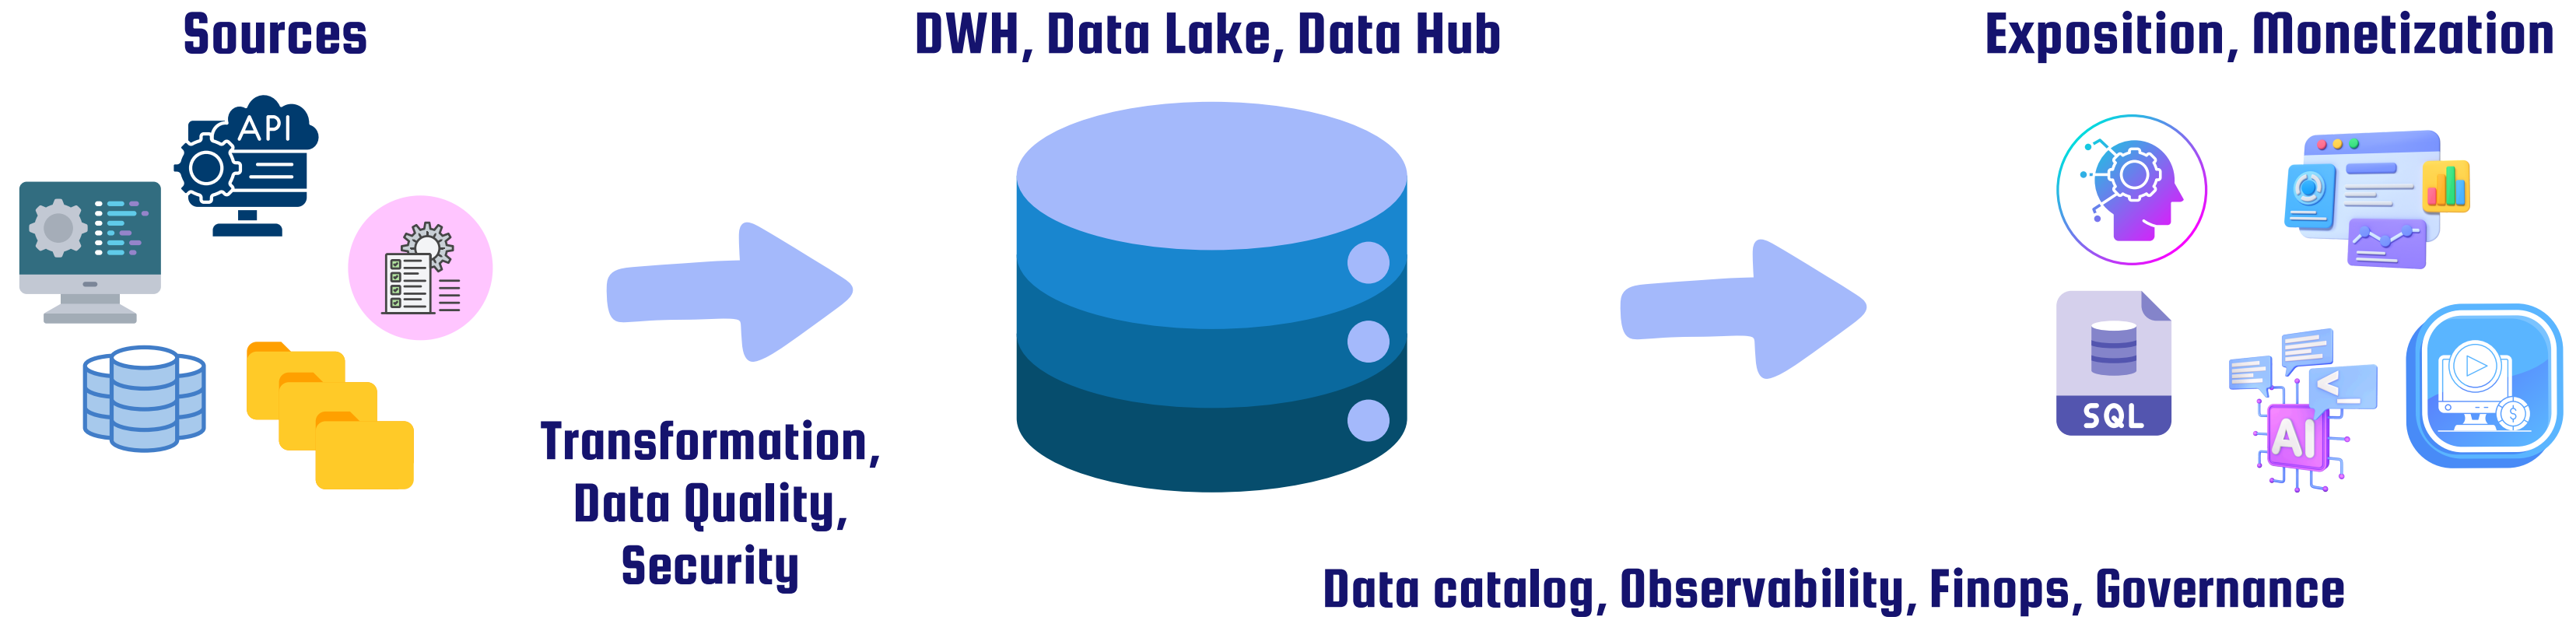

III. Value Creation Business & Innovation

 Transforming Costs into Profits

- **Usage & Use Cases:** Identifying high-value use cases (quick ROI).
- **Artificial Intelligence (AI/ML):** Integrating predictive and generative models (GenAI).
- **Monetization:** Generating direct or indirect revenue through Data (Retail Media, DaaS).

Notre mission est d'assurer l'équilibre entre ces 3 piliers, en commençant par le socle technique pour garantir que la valorisation business repose sur des fondations solides.

Building the Foundation: From Raw Data to the Data Platform

Secure and resilient connection of all your sources (ERP, Web, IoT, Apps, Files, APIs), ensuring flow fluidity (real-time or batch).

Implementing transformation pipelines (dedicated to the DWH or Data Hub) that natively embed Data Quality rules and business-defined Governance.

Designing and setting up the ideal Cloud architecture (GCP, Snowflake...). We define data organization for optimal performance and cost.

Preparing data to be consumed by Business teams, systems, and Data Monetization tools.

We embed Data Governance challenges (Quality, Compliance and Security, Data Catalog, and Data Ownership), FinOps, and observability at the core of the architecture to transform data into a managed, controlled, and reliable enterprise asset.

THE VALUE CHAIN: TRANSFORMING CONTROLLED DATA INTO ACTIONABLE LEVERS

The main consumers and use cases that guarantee the return on investment of your platform. And beyond internal optimization, how can Data become a new revenue stream?

Artificial Intelligence (AI/ML)

Predict & Anticipate: Models for sales prediction, churn, machine failure (predictive maintenance), etc.
Impact: Inventory optimization, cost reduction, targeted customer retention.

Business Intelligence (BI)

Analyze & Drive: Implementation of Dashboards (on Tableau, Power BI, Looker Studio...) for KPI monitoring and decision support.
Impact: Real-time steering, rapid identification of bottlenecks or opportunities.

Ad-Hoc Analysis

Explore & Innovate: Secure access to clean datasets (Data Forging/Curated Data) for Data Scientists or Analysts, enabling them to perform exploratory analysis for new Use Cases.
Impact: Major time savings for teams and unlocking innovation.

System Integration

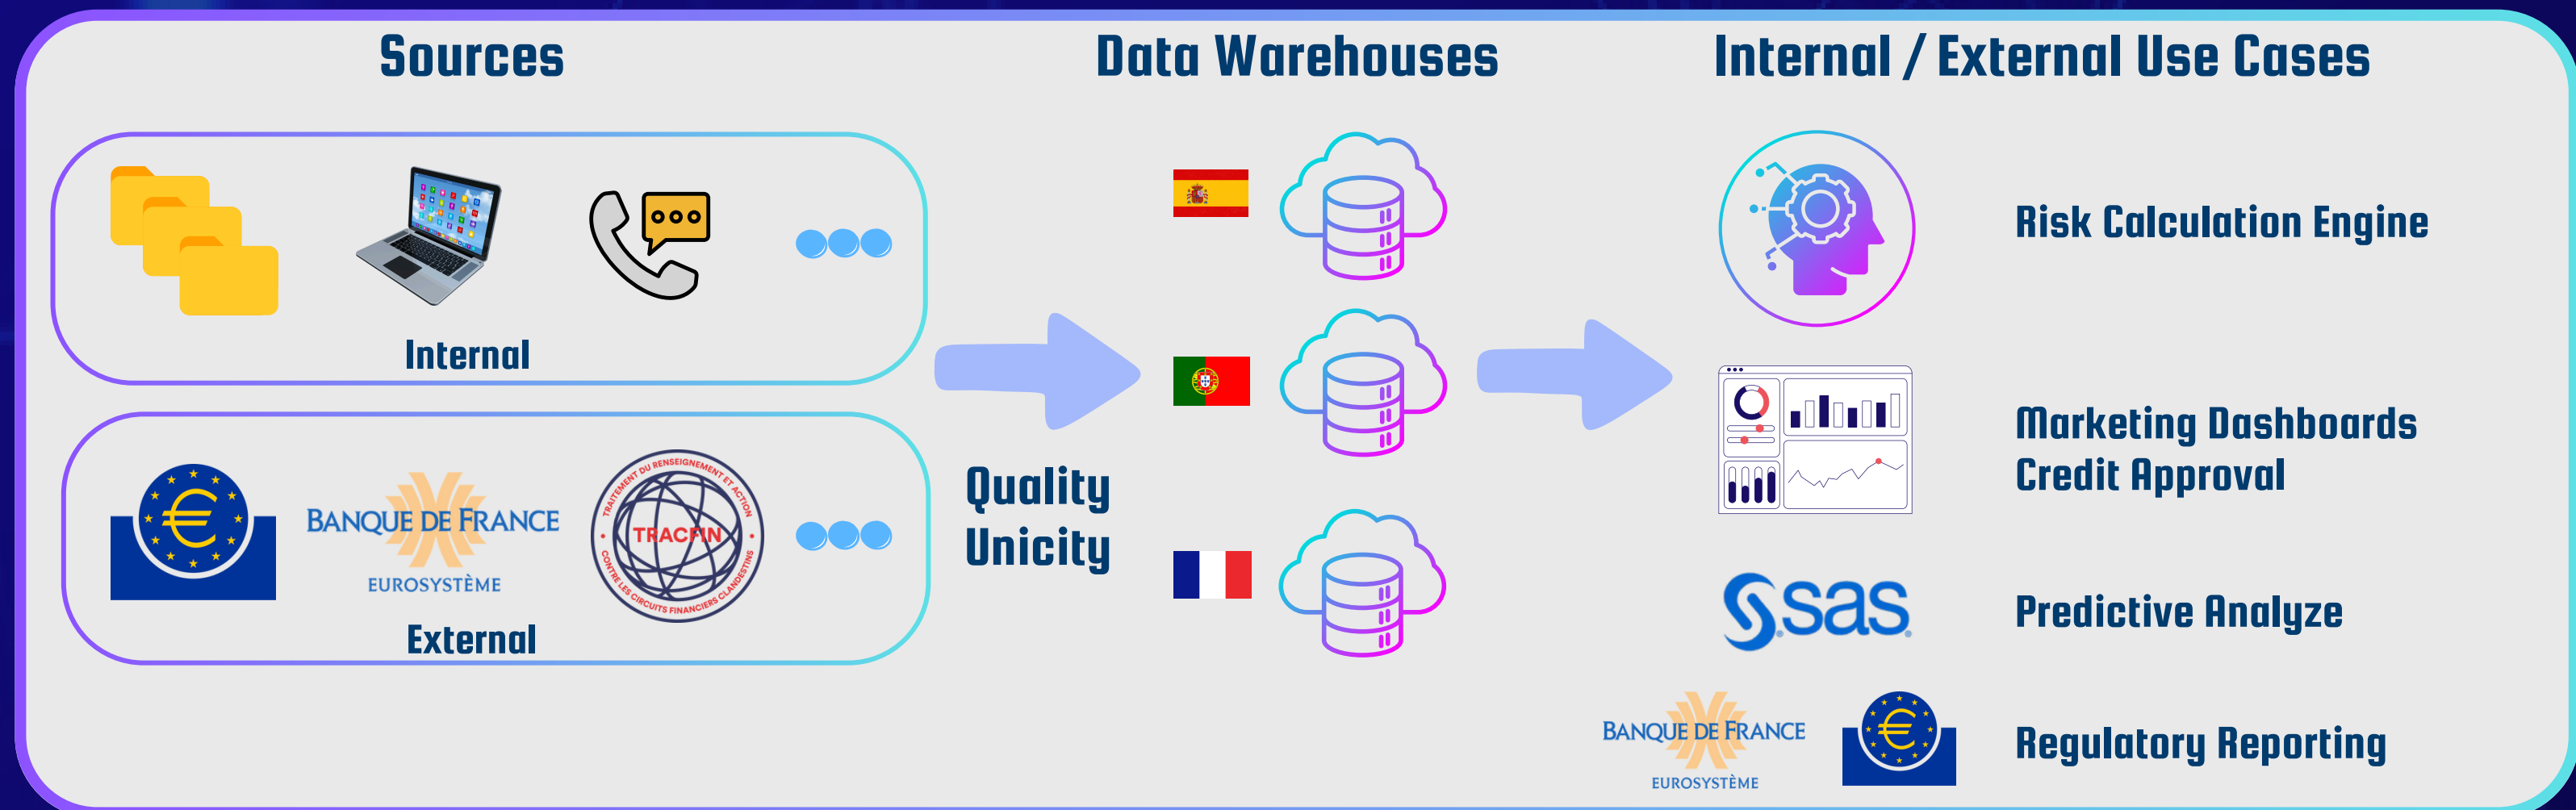

Synchronize & Operationalize: Regular and reliable extractions (TXT, CSV, JSON formats) to feed other critical systems (ERP, CRM, Legacy Systems).
Impact: Ensuring data consistency across all company tools (Single Source of Truth for Data).

The direct link between Data and Action is our priority. Thanks to our expertise as Tech-Oriented Data Project Managers, we ensure that every investment in the Data Platform leads to a high-value business use case.

Use Case I: Multi-Country Bank

Implement reliable Cloud Data Platforms and a regulatory risk calculation engine (Basel III / IFRS 9) to ensure pan-European compliance and optimize credit risk management.

- Rationalization and modernization of the Data Infrastructure.
- Implementation of Advanced Regulatory Compliance.
- Improvement of Risk Forecasting and Optimization of Credit Risk Management.

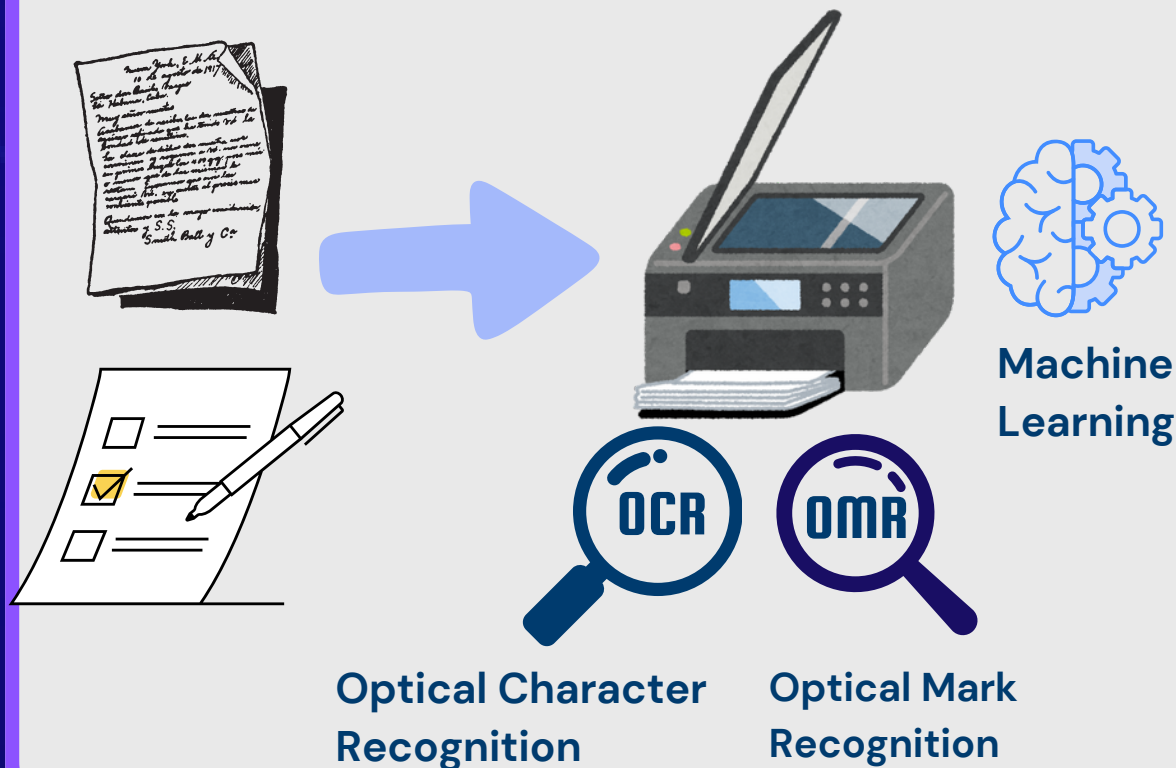

Role: Product Owner (PO): Strategic steering of projects and product roadmap (Agile). Responsible for translating business needs (specifications), ensuring architectural consistency, and complete coordination (from UAT to change management) for a 15-person team.

Use Case 2: Intelligent Document Processing (IDP) Platform

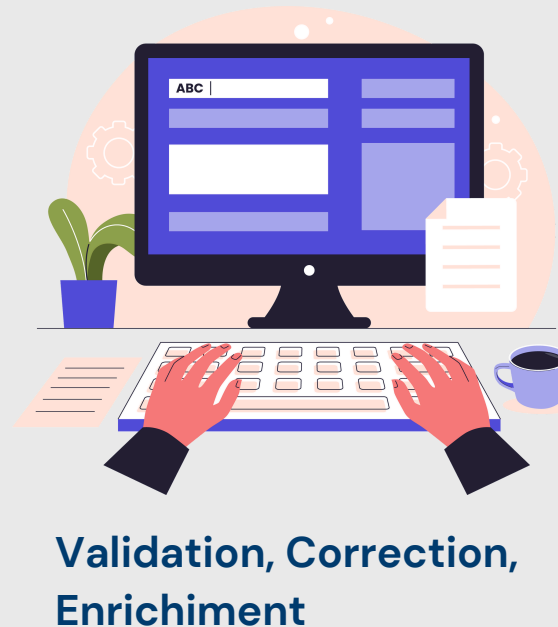

Design and deployment of an intelligent document processing chain (digitization, storage, AI extraction) to transform shareholder mail and votes into exploitable data.

- Drastic reduction in response times for shareholder requests.
- Automation of vote management at the General Shareholders' Meeting (AGM).
- Ensure live digital verification in case of a request for vote review during the AGM.

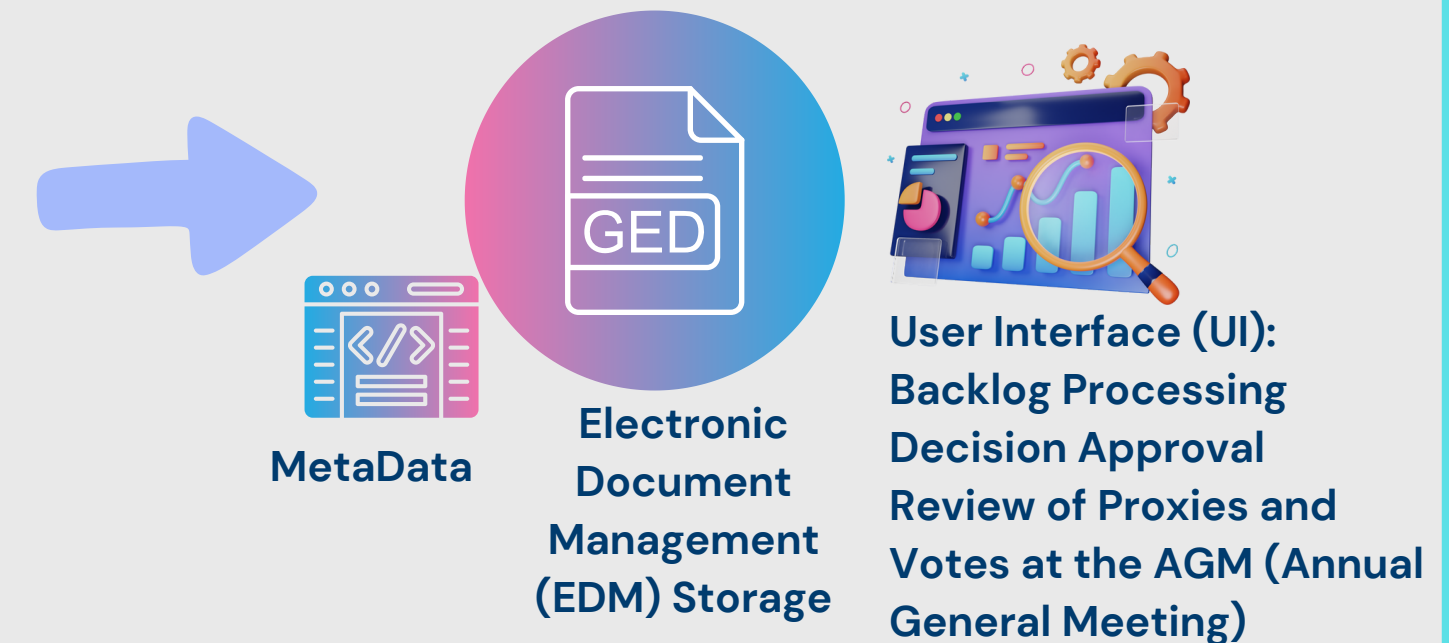

Intelligent Scanner Processing

Human Review

Business Process Management

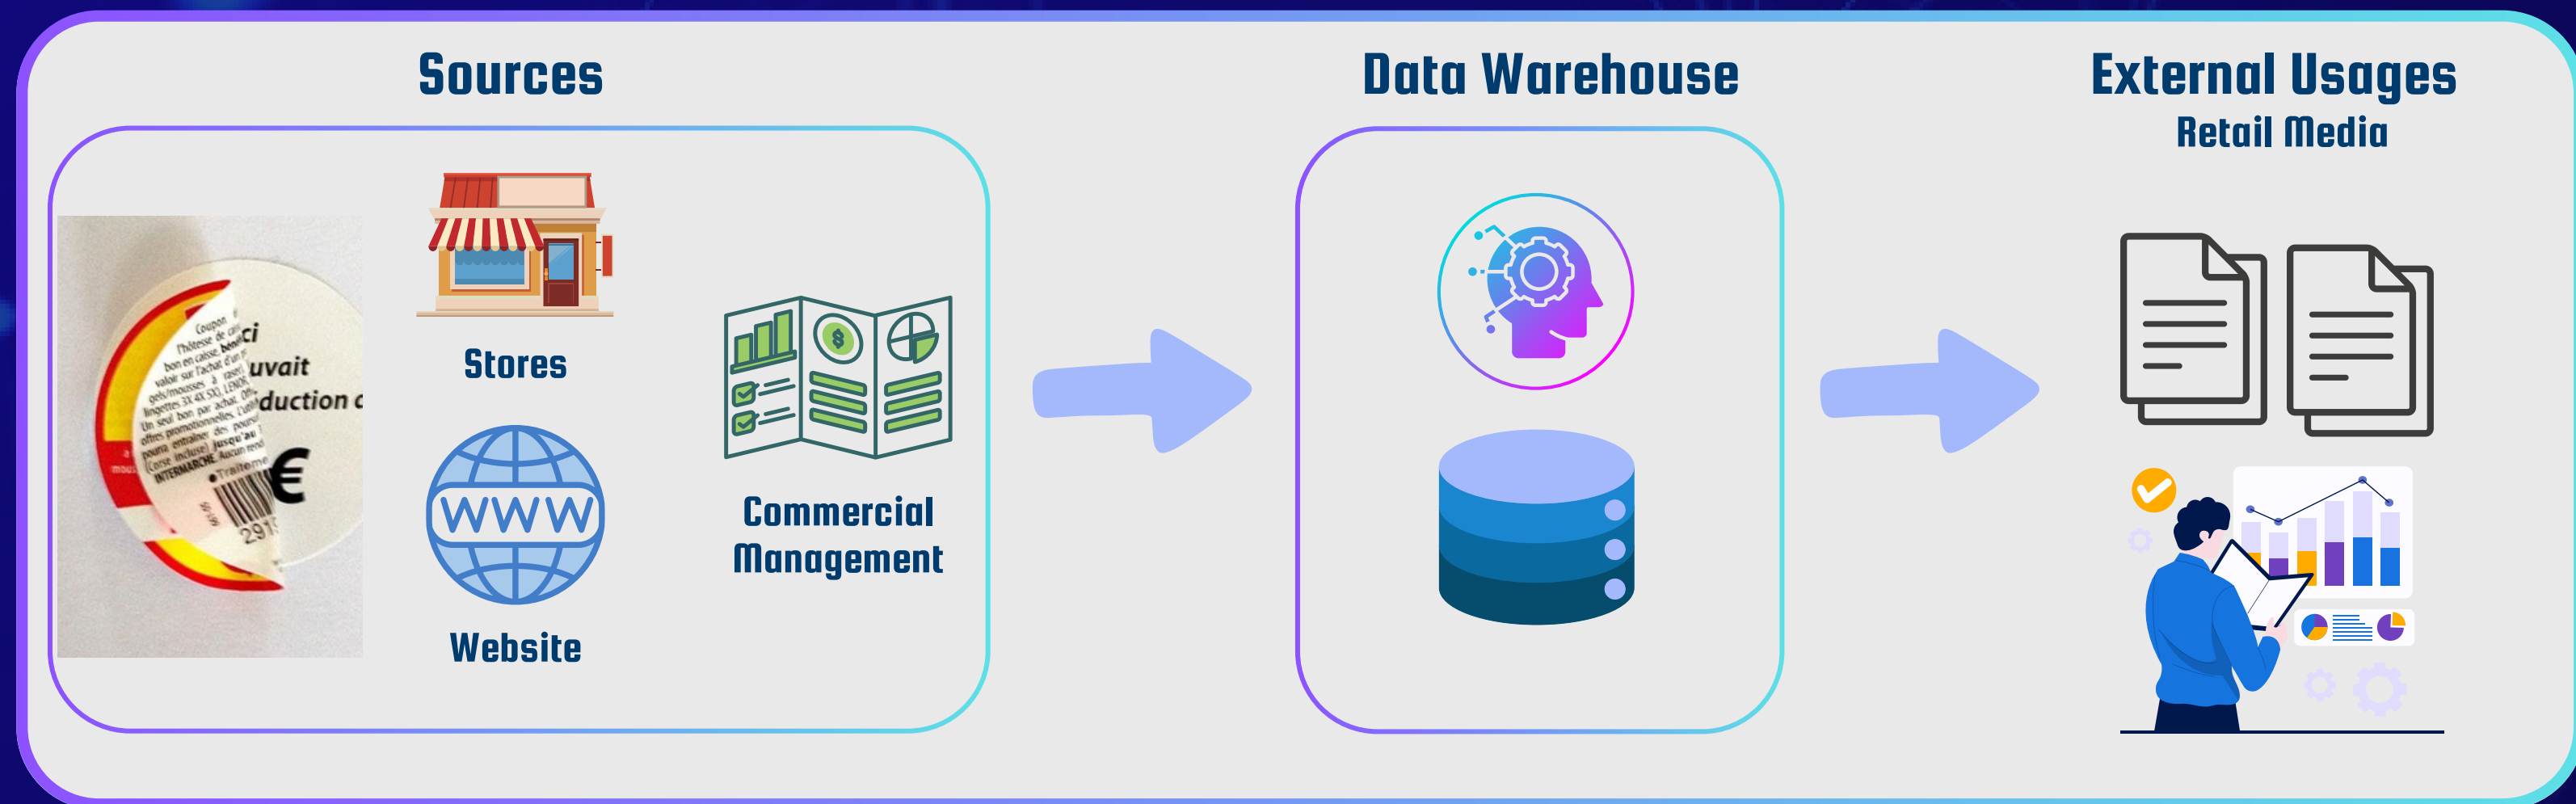

Role: BPM Business Analyst – Drafting of functional specifications, Prototyping/Mock-ups with data entry agents, Management of IT teams, budgets, and milestones, interface with Business management team and final clients (stakeholders).

Use Case 3: Retail

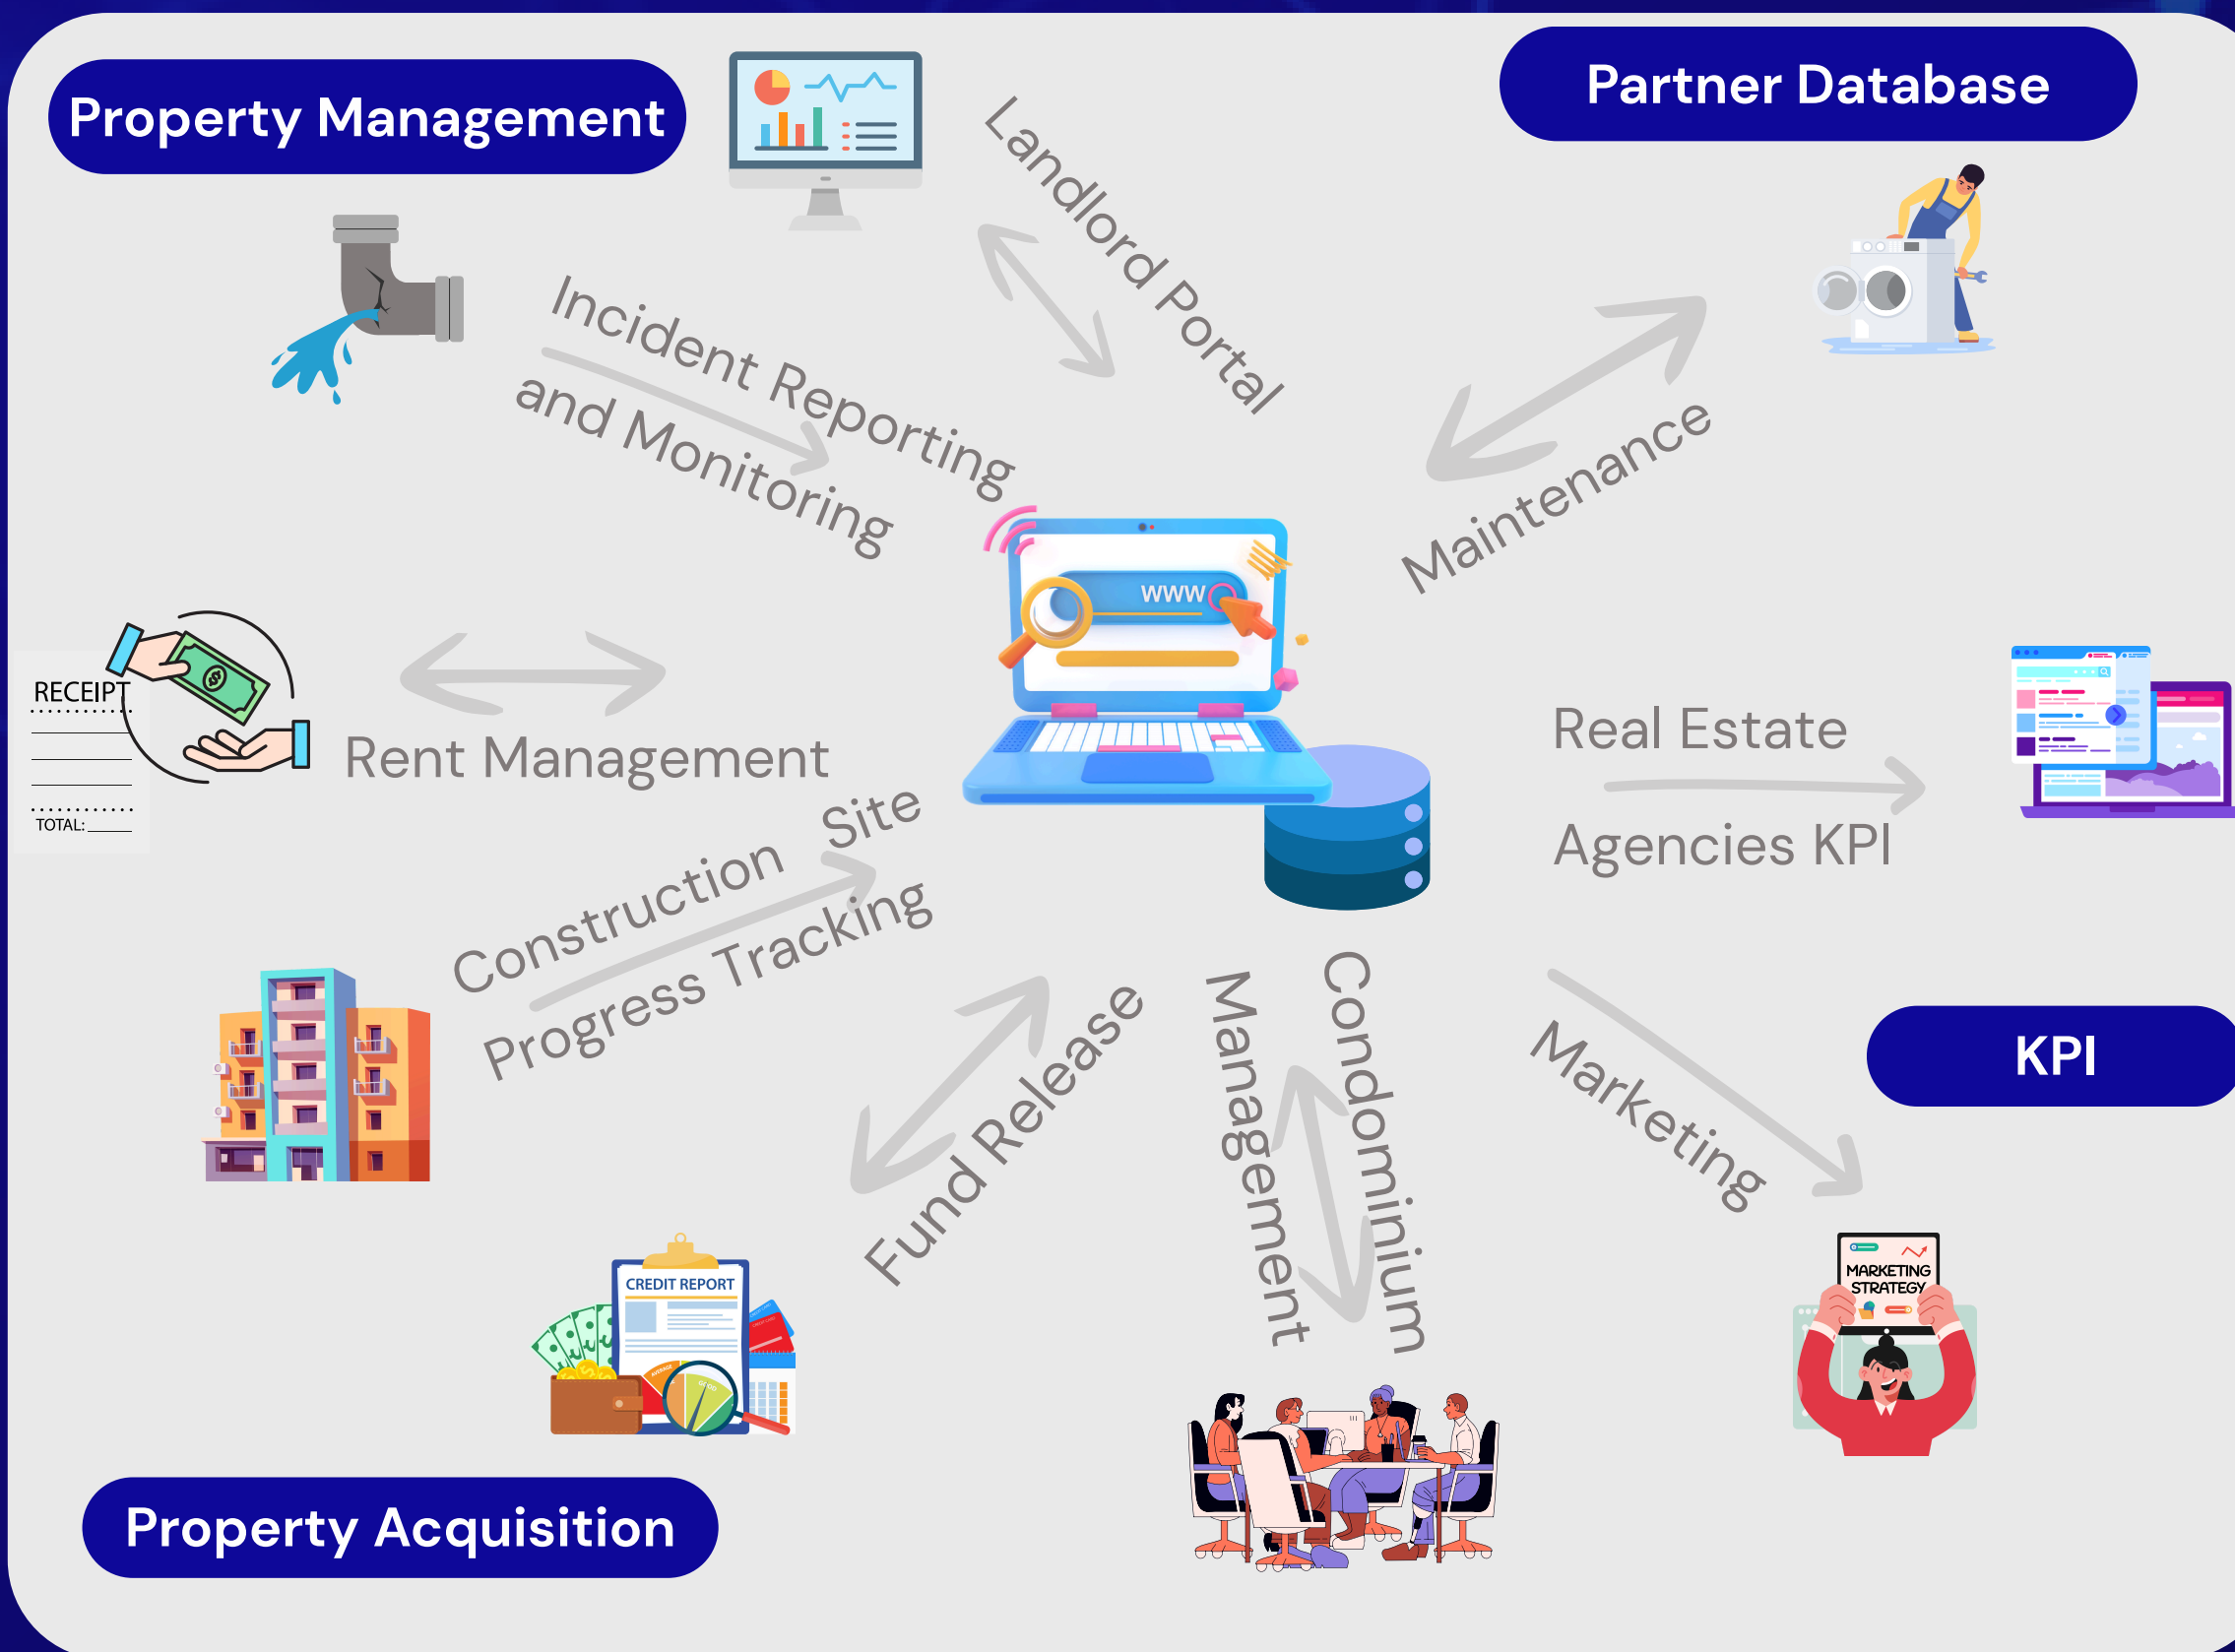

Implement a customer data monetization and valorization platform (Retail Media) to generate new revenue streams and optimize partner marketing campaigns.

- Collection of coupon usage data across all channels (in-store, drive-through/click & collect, and e-commerce).
- Sale of targeted analytical data or Retail Media advertising space to partners.
- Implementation of tools for analyzing marketing campaign feedback/returns.

Role: Lead Data Developer – Developments, technical steering, and coordination of the team's backlog. Guaranteeing the concrete realization, compliance of developments (unit tests), and securing production deployments.

Use Case 4: Real Estate Platform Enhancement

Steering key data stream integration projects (acquisition, construction sites, co-ownership, landlords, partners) and HMI (Human-Machine Interface) design.

- Improvement of operational efficiency.
- Centralization of activity steering/management (agencies, KPIs).
- Creation of Marketing campaigns.

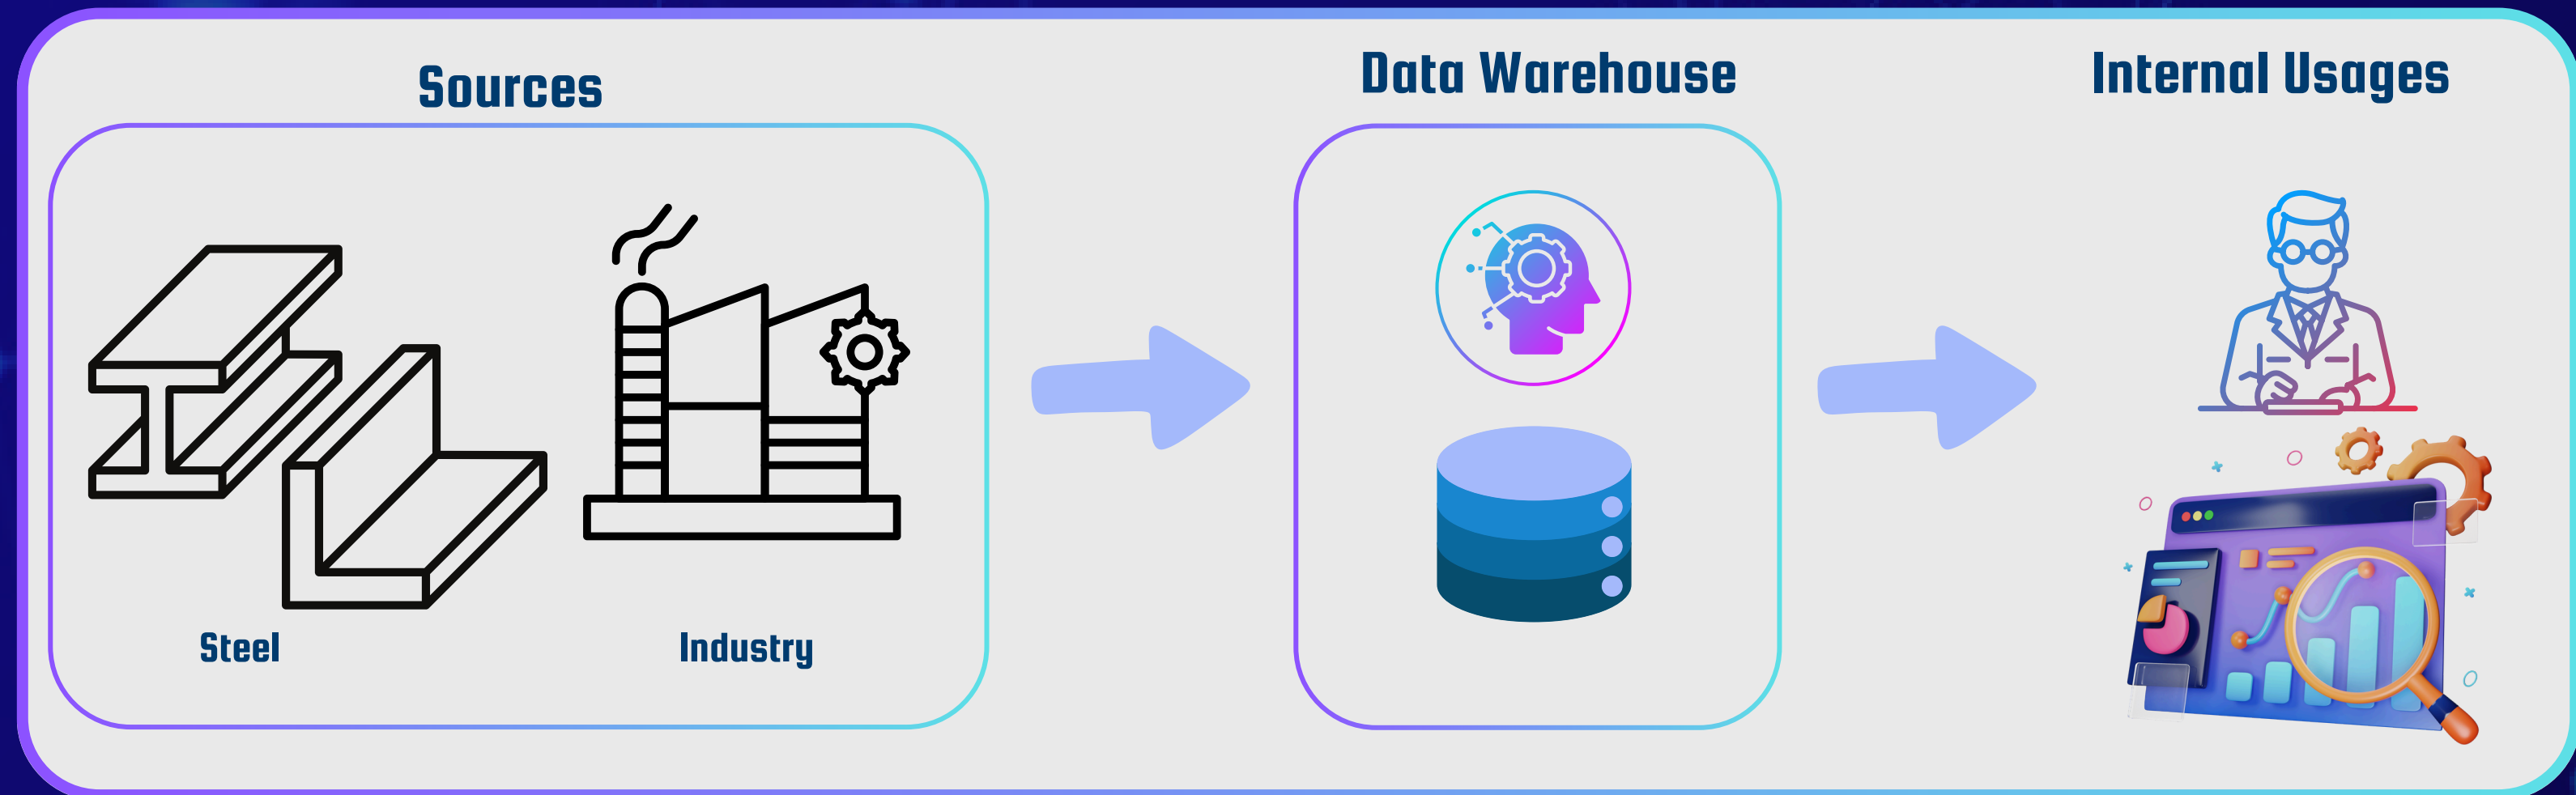

Role: Program Director

- Responsible for transversal project steering (budget, planning).
- Management and coordination of resources (technical teams, external partners).
- Support of business teams to achieve the strategic vision.

Use Case 5: Industrial Optimization Use Case

Optimize manufacturing processes (Industrial Ovens) through data exploitation to generate Return on Investment (ROI) by reducing natural gas consumption.

Implementation of a complete temperature data retrieval and valorization chain (collection, storage, and analysis reports) for precise energy steering/control.

Role: Data Developer – Ensure the concrete realization of developments, including the design and implementation of data pipelines (unit tests), for the production deployment of industrial optimization solutions.
